High turbidity will give water a cloudy appearance. This does not mean the water is unsafe necessarily, but could indicate

the water has become contaminated.

Turbidity refers to the clarity of water and the presence of particles in it. It measures

Why should you care

Acceptable range

Potential source and meaning pH is a scale from 0 to 14 that shows how acidic or basic your water is. Water with a

pH below 6.5 is acidic. In Travis County,

the water is usually more basic.

Why should you care

Your filtered drinking water

Acceptable Range

Acceptable Range

Water is safe to drink if its pH is between 6.5 and 9.5. Water close to this range can still be safe, but it might indicate water quality problems.

Your Water Utility's

Annual Report Did you know your water utility company issues a yearly water quality report? You can click on the text in the orange button to get your water utility's water quality report. This report shows that your water utility has met the government's required water quality standards. The report is based on samples

collected throughout the area in 2022.

Concerns and questions

Stay aware of your water quality

quality because it can change over time. Look out for these signs of potential problems:

It's important to stay aware of your water

Bad taste

Bad smell

or visible particles Hardness

Cloudy water

Temporary solutions

If you are worried about the safety of your

drinking water, there are some temporary actions you can take while your water is being checked. **Drink bottled water**

Bottled water is usually regulated and must meet

quality standards set by government agencies. Know more about commercially bottled water

Use a water filter

You can install filters where

water enters your home or where you use it. They can

remove contaminants like iron, lead, and sulfur, and also improve the taste of your water. Choosing Home Water Filters & Other Water Treatment Systems | CDC

- **WCWH** sampling scope
- Sampling within one month 30

Indoor

(kitchen faucet)

Water samples were collected from your home 3 times over a month. Outdoor samples were taken each visit, and an indoor sample from the kitchen faucet was taken once to compare with the outdoor samples. Through this way, we provide a more complete picture than a single sample, which is important because contaminant levels can change due to various factors like:

 Seasonal variations in rain or runoff. Changes in water treatment plant

Random events like pipe repairs.

As of June 2024, we have collected:

Distribution of WCWH water samples by utility and water source

The figures below show the distribution of homes samples by their water utility and where those utilities source their water.

Water Utilities

- Austin Water
- SouthWest Water Company
 Goforth
- Aqua Water Suply Corporation
 Manville
- Creedmoor Water Sources

Sampled by utilities

quality" mean? Water quality means the condition of the water based on its chemical, physical, and

What does "water

biological properties. It tells us if the water is good for a specific purpose. For example, the quality of water that

water utilities supply to households should be better than the quality of the water in lakes and streams.

The Texas Commission on Environmental Quality (TCEQ) and the Environmental Protection Agency (EPA) have set standards for drinking water quality. All water treatment

plants in the country must meet these standards. These standards ensure that the water provided to households is treated to

remove bacteria and other pollutants. Water utilities must treat drinking water to

make it safe for household use.

Return to table of contents

What can affect the water quality in your home?

Several factors can influence the quality of the drinking water supplied to your home. These factors include:

Source of water

The water in your home typically comes from a lake, river, or groundwater source.

Treatment process

The way the water is treated at the treatment plant before it reaches your home can affect its quality.

Drinking water distribution system

The network of pipes that carry water to your home can have an impact on its quality.

Home plumbing and filtration systems

The plumbing in your home and any installed water filtration systems can influence the water quality.

Water usage

The quality of the water in your home can vary based on the amount of water you use and the timing of when you use it.

Why is WCWH testing water quality?

In our study, WCWH participants expressed a desire to know more about the quality of the water in their homes.

We aim to gather information about the water quality in homes across the county and understand how it varies among different water utilities in the area.
