Test Results Overview

Your water quality

WCWH Spot Test Results

Date of water sample: 08/07/2026

Hornsense ID: MOCK-0001

In acceptable range

- ✓ In agreement with your Utility Company Report
- [View your water utility's annual report](#)

This is mock data for a template preview only.

- ✓ Aligns with the WCWH average measurements in your area
- ✓ Meets the standards established by the Texas Commission on Environmental Quality.

Since the tests we did were within the governmental standards

- ✓ You don't need to take any action right now.

Parameters' snapshot

The WCWH test is based on 8 parameters:

- | | |
|-----------------|----------------------|
| • Free chlorine | • Lead |
| • Nitrate | • Nitrite |
| • Ammonia | • Bacteria (E. Coli) |
| • Turbidity | • pH |
-
- In normal range
 - Out of normal range
 - No regulated standard

Important Note

This report does not show the complete picture of your water quality

The EPA has legal limits for over 90 parameters. Whole Communities-Whole Health tests for 8 parameters in drinking water because of time and cost.

We encourage you to learn more information about the parameters on: [Drinking Water Regulations by US EPA](#)

Water quality is always changing

These results show the water quality at the time we took your samples. Your water quality may change over time.

2

Detailed Test Results

Glossary

Acceptable range is based on regulations from the Environmental Protection Agency (EPA) and the Texas Commission on Environmental Quality (TCEQ)

Outdoor water quality measures are based on the samples that were collected outside your home and reflect the quality of the water that the water utility company provides to your home at the time the sample was taken.

Indoor water quality measures are based on additional samples from inside your home to compare the water from your indoor tap to the water provided by the water utility.

By examining both samples, we can better understand how water usage in your home, as well as your plumbing and filtration system (if any), impact your household's water quality.

Average community level measures are based on all samples taken by WCWH from the community, including more than 230 samples from a total of 55 homes from Bastrop County, Hays County, and Travis County.

Met governmental standards refers to whether the parameters meet the standards of the Texas Commission on Environmental Quality.

WCWH results of 8 measures

Date of water sample

08/07/2026

How to read your results

mg: milligram μ g: microgram L: liter
NTU: Nephelometric Turbidity Unit

Free chlorine

Acceptable range

Out of acceptable range

Outdoor

Your level (mg/L)

Average community level (mg/L)

Indoor

Your kitchen tap (mg/L)

Average community level for kitchen tap (mg/L)

Potential source and meaning

Disinfectant is added at the treatment plant to control the growth of bacteria and viruses in the water. It helps ensure that the water reaching your house is safe to drink. Low levels of disinfectant should be present in the water to maintain its safety.

Why you should care

A certain amount of disinfectant is needed when the water enters your home. This helps make sure no harmful bacteria grows between the treatment plant and your home.

Lead

Acceptable range

Out of acceptable range

Outdoor

Your level (µg/L)

Average community level (µg/L)

Indoor

Your kitchen tap (µg/L)

Average community level for kitchen tap (µg/L)

Potential source and meaning

Some plumbing systems, like pipes and fixtures, are made of lead. When these corrode, they can increase the levels of lead in drinking water.

Why you should care

High lead levels can cause harmful health effects, especially for pregnant women and young children.

Nitrate

Acceptable range

Out of acceptable range

Outdoor

Your level (mg/L)

Average community level (mg/L)

Indoor

Your kitchen tap (mg/L)

Average community level for kitchen tap (mg/L)

Potential source and meaning

Runoff from fertilizer use; leaching from septic tanks, sewage.

Why you should care

High levels of these substances can harm your health.

Nitrite

Acceptable range

Out of acceptable range

Outdoor

Your level (mg/L)

Average community level (mg/L)

Indoor

Your kitchen tap (mg/L)

Average community level for kitchen tap (mg/L)

Potential source and meaning

Runoff from fertilizer use; leaching from septic tanks, sewage.

Why you should care

High levels of these substances can harm your health.

Ammonia

There is no regulated standard for this parameter

Outdoor

Your level (mg/L)

Average community level (mg/L)

Indoor

Your kitchen tap (mg/L)

Average community level for kitchen tap (mg/L)

Potential source and meaning

Runoff from fertilizer use; leaching from septic tanks, sewage.

Why you should care

High levels of these substances can harm your health.

Bacteria (E. Coli)

Acceptable range 0

Outdoor

Your level Not detected

Met governmental standards? Yes

Average community level Not detected

Indoor

Your kitchen tap Not detected

Met governmental standards? Yes

Average community levels for kitchen tap Not detected

Potential source and meaning

E. coli is a sign that there might be fecal contamination. This means there could be waste or sewage in the water, which can be dangerous for your health.

Why you should care

Presence of E. coli can cause sickness.

Turbidity

Acceptable range

Out of acceptable range

Outdoor

Your level (NTU)

Average community level (NTU)

Indoor

Your kitchen tap (NTU)

Average community level for kitchen tap (NTU)

Potential source and meaning

Turbidity refers to the clarity of water and the presence of particles in it. It measures how clear or cloudy the water appears.

Why you should care

High turbidity will give water a cloudy appearance. This does not mean the water is unsafe necessarily, but could indicate the water has become contaminated.

**pH**

There is no regulated standard for this parameter

Outdoor

Your level

Average community level

Indoor

Your kitchen tap

Average community level for kitchen tap

Potential source and meaning

pH is a scale from 0 to 14 that shows how acidic or basic your water is. Water with a pH below 6.5 is acidic. In Travis County, the water is usually more basic.

Why you should care

Water is safe to drink if its pH is between 6.5 and 9.5. Water outside this range can still be safe, but it might indicate water quality problems.

Your Water Utility's Annual Report

Did you know your water utility company issues a yearly water quality report? You can click on the orange text to get your water utility's water quality report. This report shows that your water utility has met the government's required water quality standards. The report is based on samples collected throughout the area in 2025.

This is mock data for a template preview only.

Concerns and questions

Stay aware of your water quality

It's important to stay aware of your water quality because it can change over time. Look out for these signs of potential problems:

Bad taste

Bad taste

Cloudy water or visible particles

Bad smell

Hardness

Temporary solutions

If you are worried about the safety of your drinking water, there are some temporary actions you can take while your water is being checked.

Drink bottled water

Bottled water is usually regulated and must meet quality standards set by government agencies.

[Know more about commercially bottled water](#)

Use a water filter

You can install filters where water enters your home or where you use it. They can remove parameters like iron, lead, and sulfur, and also improve the taste of your water.

[Choosing Home Water Filters & Other Water Treatment Systems | CDC](#)

Report your concern

If you have concerns about water quality...

Contact Texas Commission on Environmental Quality (TCEQ)

TCEQ has set standards for drinking water quality

If you have concerns, you can report the problem anonymously or leave your name and contact information.

TCEQ

Learn About Your Report

This test is a spot check

Samples were collected from:

- Hose tap immediately outside your home after flushing the water line
- Kitchen faucet inside your home after flushing the water line.

*Hose tap
outside home*

Indoor tap

These sources:

- Represent your water supply
- Minimize contamination
- Avoid the influence of internal plumbing
- Meet regulatory guidelines

As of February 2025, we have collected:

more than

230

Water samples

total

55

Homes

Bastrop
Hays
Travis Counties

Distribution of WCWH water samples by utility and water source

The figures below show the distribution of homes sampled by their water utility and where those utilities source their water.

Water Utilities

- City of Austin Water & Wastewater
- SouthWest Water Company
- Aqua WSC
- Goforth SUD
- City of Manor
- Manville WSC
- Creedmoor Maha WSC
- County Line SUD
- City of Kyle
- Cottonwood Creek MUD1
- City of Killeen
- Well Water

Water Sources

i Sampled by utilities

What does "water quality" mean?

Water quality means the condition of the water based on its chemical, physical, and biological properties. It tells us if the water is good for a specific purpose.

For example, the quality of water that water utilities supply to households should be better than the quality of the water in lakes and streams.

The Texas Commission on Environmental Quality (TCEQ) and the Environmental Protection Agency (EPA) have set standards for drinking water quality. All water treatment plants in Texas must meet these standards.

These standards ensure that the water provided to households is treated to remove bacteria and other pollutants. Water utilities must treat drinking water to make it safe for household use.

What can affect the water quality in your home?

Several factors can influence the quality of the drinking water supplied to your home. These factors include:

Source of water

The water in your home typically comes from a lake, river, or groundwater source.

Treatment process

The way the water is treated at the treatment plant before it reaches your home can affect its quality.

Drinking water distribution system

The network of pipes that carry water to your home can have an impact on its quality.

Home plumbing and filtration systems

The plumbing in your home and any installed water filtration systems can influence the water quality.

Water usage

The quality of the water in your home can vary based on the amount of water you use and the timing of when you use it.
